

## High Pressure Hoses – Jet Flusher

### ■ Leader Hose Colour

- The leader hose is a rubber high pressure hose attached to the end of a Jet Flusher main hose, approximately 3 meters or more in length.
- The leader hose is purposely a different colour from the main hose to alert the operator that the nozzle is approaching when being retracted.
- The leader hose can be any colour and its pressure rating must match the pressure rating of the main hose.

### ■ Restraint for Leader/Main Hose Connection

- Dual wall adhesive heat shrink sleeves are a streamlined option to restrain the connector between the Jet Flusher leader hose and main hose.
- They fit snugly over the connector, creating a strong tight seal, preventing the hose from flailing if it uncouples.
- Sleeve must be monitored for wear and replaced as needed.

### ■ Safety Grill – Anti Withdrawal Device (AWD)

- Prevents wear to the leader and main hose.
- Provides fall protection working around open manholes.
- Reduces the risk of an uncontrolled jetter nozzle exiting the manhole.
